

SURGICAL INFORMATION PACKET

Your pet has been scheduled for an upcoming surgery. In our attempt to assist clients, we have put together this packet to make surgery day as easy and stress-free as possible.

In addition to this letter, you will find that the following information has been enclosed:

1. Pre-Anesthetic Blood Testing Information Form (**Bring in Day of Surgery**)
2. Surgical Information Sheet (**Bring in Day of Surgery**)

Please read carefully all the enclosed information. If you have any questions, please feel free to call us. On the surgery day, we require you to review and sign an **Authorization/Estimate Form** - which allows you to choose optional services.

We require a phone number(s) where you can be reached surgery day.

Failure to be reached on the day of the procedure may result in postponement of the surgery and any necessary procedure.

The night before the scheduled surgery...

- **Withhold all food and treats after 10:00pm.**
- **Water may be left down after this time period.**
- **If you are currently administering any medications, vitamins and/or injections. Withhold the morning doses unless otherwise instructed by the doctor.**

Please make arrangements for your pet to be dropped off on the morning of scheduled surgery, unless other arrangements have been made in advance. For example, new clients are required to have a pre-surgical visit the morning of procedure and may not have an appointment until later. At time of drop off, our team will be happy to answer any questions/concerns and collect the enclosed/completed **Authorization Form**.

Our veterinary nurse will escort him/her to the surgical prepping area to wait for their surgery. Your nurse will collect all blood samples and tests prior to surgery.

If any questions arise, the doctor may contact you at the number on the Authorization Form.

You are welcome to check up on your pet, however, we ask that you allow plenty of time for the scheduled procedure to be done. At this time, we will be able to give you an idea when they may be discharged. When you arrive to take your pet home, the veterinary nurse will go over all discharge instructions verbally and give you a written copy, then the receptionist will bill you out. If you do not understand any instructions, please do not hesitate to ask us to go over them one more time.

We hope surgery day will be a pleasant experience. Remember, our team knows surgery can be an anxious time and we are always available to answer any and all questions concerning the upcoming procedure.

We look forward to serving you and your pet on the upcoming surgery day and years to come.

PRE-ANESTHETIC BLOOD TESTING INFORMATION FORM

PLEASE READ CAREFULLY

Our greatest concern is the well being of your pet. Before putting them under anesthesia, we routinely perform a comprehensive physical examination.

We also require that a **Pre-Anesthetic Blood Profile** be performed on all pets' undergoing anesthesia to maximize patient safety.

The **Pre-Anesthetic Blood Profile** helps alert our surgeon to the presence of dehydration, anemia, infection, diabetes and/or kidney or liver disease that could complicate the procedure. These conditions may not be detected **without** a pre-anesthetic profile thus not allowing for the most appropriate and safest anesthetic regime to be administered. These tests are similar to those your own physician would run if you were to undergo anesthesia. In addition, these tests may be useful if your pet's health changes to develop faster, more accurate diagnoses and treatments.

Blood work 3-5 days prior to the procedure is recommended. This will allow us to be able to offer more comprehensive blood test for your pet. Also, any health concerns found on blood test can be addressed prior to the surgery day. However, same day blood work is still available if it is the best for your schedule.

1. **The Complete Blood Count (CBC) and Pre-Anesthetic Profile** which includes:

- **CBC:** PCV (Anemia), White Blood Cell Count (Infection) & Red Blood Cell Count (Anemia/Bleeding Disorder), Platelet Count (Clotting Disorder), Hemoglobin.
- **Profile:** BUN and Creatinine (Kidney), ALP, GGT and ALT (Liver), Glucose (Sugar), Total Protein (Dehydration), Albumin and Globulin (Protein), SDMA (Early kidney detection) and more.
 - **Canine Heartworm testing (Tick fever, Lyme, Anaplasmosis included) and FeLV/FIV testing (Feline leukemia and Feline AIDS) for felines can be added at additional cost.**

You will notice other tests available that are not included in the above choices. We have selected tests that give the doctors a suitable overview of healthy patients. However, if the patients are in their senior years (above 7 years old) or are sick, the comprehensive diagnostic profile will be recommended by your doctor.

On the **Feline Patient Authorization Form**, our feline owners will see a **FeLV/FIV Test** option. We highly recommend this test be preformed on all feline patients at least once in their lives because Feline Leukemia and Feline Immunodeficiency Virus (Feline Aids) are viruses for which no cure exists. If your pet goes outside, we recommend administering the Feline Leukemia vaccine as well. Please ask questions if you would like to learn more about Feline Leukemia and Feline Aids.

We realize surgery and anesthesia are scary for both the owner and patient and we attempt to make surgery day as safe and comfortable for all involved. The physical examination and blood work done prior to any surgical procedure allows us to best minimize anesthetic and surgical risks and maximize patient safety.

If you have any questions or hesitations about the scheduled procedure, please do not hesitate to call us to discuss any aspect of the upcoming procedure.

SURGICAL INFORMATION FORM

PLEASE READ CAREFULLY

Anesthetic Procedures & Risks

We use a combination of pre-anesthetic medications/injectable and/or inhalant anesthetics to achieve optimum levels of anesthesia that are safe.

For short procedures, an injectable anesthetic is given alone that produces a good plane of surgical anesthesia with a quick recovery.

For most procedures, your pet is anesthetized and then intubated (insertion of a tube into the trachea or wind pipe). This will ensure that he/she is able to receive oxygen at all times and prevents aspiration of any fluids into the lungs.

For procedures that require minimum sedation, an injectable anesthetic is given that produces a good plane of sedation with quick recovery. Anesthesia is maintained with a gas anesthetic, Sevoflurane, which is very safe and is not metabolized by the body. This allows us to have more control over anesthetic depth and it is less irritating to the airways.

Monitoring & Pain Management-Monitoring of patients during anesthesia is done in two ways. First, the doctor and a veterinary nurse are with your pet continuously from beginning of anesthesia to recovery. Second, we have a computerized monitor that records heart rate, blood pressure, oxygen levels, respiration, ECG, rectal temperature.

GHAHC strongly believes in compassionate, quality, medical care for our patients. As a result, all surgery patients will receive pain management before, during and after surgery. Additionally, pain medication may be prescribed home. Additional information will be given at discharge. We hope this program will reduce any discomfort experienced and aid in a quicker recovery.

Intravenous Catheterization & Fluids

We will place an IV catheter and use IV fluids during all anesthetic procedures and during recovery as needed. This allows us to have quick, available access to the circulatory system (blood) in case of an unforeseen emergency. The fluids help provide support to the circulatory system and prevent dehydration, as well as aid in a quicker recovery from anesthesia.

Potential Surgical Complications

1. Canine and Feline Spay

1. Bleeding 2. Infection 3. Recurrent Heat 4. Urinary Incontinence 5. Weight Gain 6. Suture Reactions

2. Canine and Feline Castration

1. Bleeding 2. Infection 3. Testicular Swelling 4. Suture Reaction (Canine Only)

3. Tumor/Lump Removal

1. Bleeding 2. Infection 3. Swelling and Drainage 4. Suture Reaction

4. Teeth extraction

1. Bleeding 2. Infection 3. Swelling and Drainage 4. Suture Reaction

It is important for you to understand that there is always a risk of anesthetic and surgical complications anytime these procedures are performed. We strive to take the highest quality care of your pet and take all the added precautions you allow to avoid potential problems. Thank you for entrusting them to us.
